

# Changelog

All notable changes to Gestiona Gateway API are documented in this file.

## [1.9.0]

### Added

- Added POST `/addon/authorizations` to create an authorization.
- Added GET `/addon/authorizations/{authId}` to verify authorization state.

## [1.8.1]

### Added

- Added GET `/processes/{process_id}/documents/{document_id}/signatures` to get document signature information.

## [1.8.0]

### Added

- Added POST `/processes/related` to create a relation between processes.
- Added DELETE `/processes/{process_id}/related/{related_process_id}` to delete a relation between processes.
- Added GET `/processes/{process_id}/related` to get related processes.

## [1.7.0]

### Added

- Added GET `/queues/connectors/{connector_name}/{message_id}` to get signed document or message information.
- Added POST `/queues/connectors/{connector_name}/{message_id}` to process a message.
- Added GET `/queues/connectors/{connector_name}` to get messages for a connector.

## [1.6.2]

### Changed

- GET `/processes/assignees/users` now accepts `username` as a query parameter. The query parameter takes precedence over the JSON body.

## [1.6.1]

### Changed

- Added `activityId` to each procedure returned by the activity procedures endpoint.

## [1.6.0]

### Added

- Added GET `/processes/assignees/users` to get an assignable user.
- Added GET `/processes/assignees/groups` to get assignable groups.

- Added GET `/activities` to get all activities.
- Added GET `/activities/{activity_id}/procedures` to get the procedures for an activity.

### **Changed**

- When a newly created process has selectable titles, the first title is sent in the open-file request as `selectable_title`.

## **[1.5.0]**

### **Added**

- Added POST `/processes` to create a Gestiona process.

## **[1.4.0]**

### **Added**

- Added GET `/processes/{process_id}/documents` to retrieve all documents from a process.
- Added GET `/processes/{process_id}/documents/{document_id}` to retrieve the documents from a folder.

## **[1.3.2]**

### **Fixed**

- Ignored an unresolved Postman X-User-Access-Token variable whose literal value was `{{X-User-Access-Token}}`.

### **Changed**

- Added masked authentication-token logging in Debug mode.

## **[1.3.1]**

### **Added**

- Added GET `/processes?process_number={process_number}` to resolve a process ID from a process number.

### **Changed**

- Added debug logging for request bodies sent to the Gestiona API.
- Read the API version from the project file instead of `appsettings.json`.
- Added zone (Concelho) to third-party addresses.
- Added parish code (Freguesia), obtained from the last path segment of the link whose `ref` is `parish`.
- Added Gestiona's `second_surname` field to the third-party model.

## **[1.2.1]**

### **Added**

- Added support for the X-User-Access-Token header. When present, its value is used as X-Gestiona-Access-Token; otherwise, `Gestiona__AccessToken` is used.
- Added Swagger UI at `/swagger` in the Development environment.

## **[1.1.1]**

### **Added**

- Added middleware that logs request client information.

- Added GET /processes/{process\_id}/thirds.
- Added GET /processes/thirds?process\_number={process\_number}.
- Added GET /thirds/{third\_id}.
- Added GET /thirds?nif={nif}.

### ***Changed***

- Request-body logging no longer writes document content; it only records that content is present.
